Works on all the Windows Operating Systems. GoDownload... HOLIDA is a system for choosing the most suitable destination for a fluid by computer. It is used to provide the general properties of the fluid. HOLIDA uses the combination of the Corotron method and Beer-Lambert law. The choice of a destination, including the topography, and the

boundary conditions are done automatically, comparing the point of view of the flow of a fluid on the terrain. HOLIDA can be used only in a simulation of flow. It uses the concept of the fluid domain which is divided into meshes. HOLIDA in the computer runs extremely fast. It is used in different fields such as the design of a landfill cell, for the selection of seeding of porous rock, and modeling of the hydraulic conductivity of the soils. HOLIDA can be used in any modeling software that uses the Grid-p2p surface communication model.

HOLIDA is easy to use in Windows, Linux, and a platform for all operating systems. In Linux, the executable system run without any changes in the building of the sources. The executable executable can be adjusted to Linux OS. It is a free software distributed under the GNU GPL license. Features: - HOLIDA is a system for choosing the most suitable destination for a fluid by computer. It is used to provide the general properties of the fluid. HOLIDA uses the combination of the Corotron method and Beer-Lambert law.

The choice of a destination, including the topography, and the boundary conditions are done automatically, comparing the point of view of the flow of a fluid on the terrain.
